

# ***M<sup>3</sup> Overview and Working with M<sup>3</sup> Data***

Peter Isaacson

M<sup>3</sup> Data Tutorial at LPSC

March, 2011

## *Topics to be discussed*

- Instrument overview
- M<sup>3</sup> observation history
- Dataset description
- Calibration pipeline
- Dataset and R4 calibration issues
- Converting radiance to I/F with ENVI

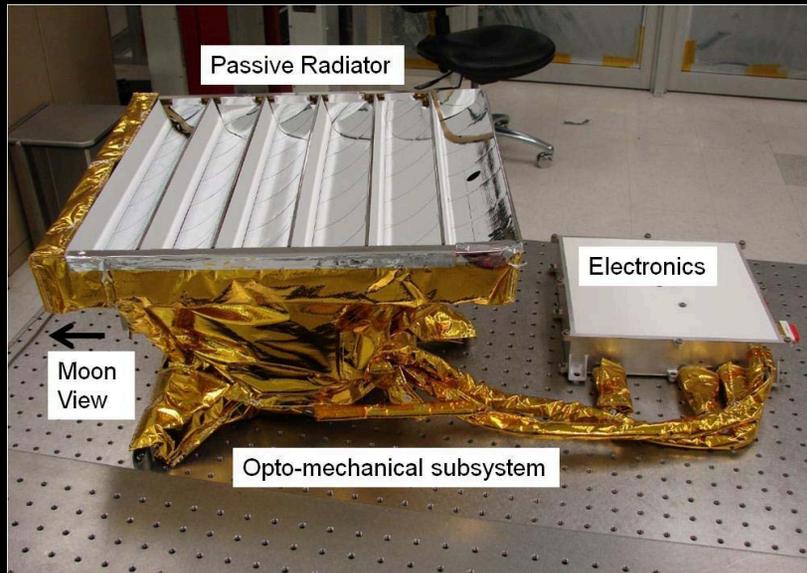

## *For Reference*

- Slides and example data from this workshop available at:  
<http://m3.jpl.nasa.gov/m3data.html>
- References for more complete description of these topics:
  - Green et al. (JGR, Under Review)
  - Boardman et al. (JGR, In Press)
  - Clark et al. (JGR, In Press)

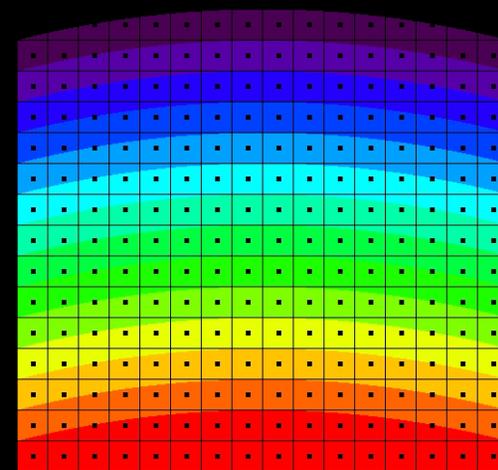

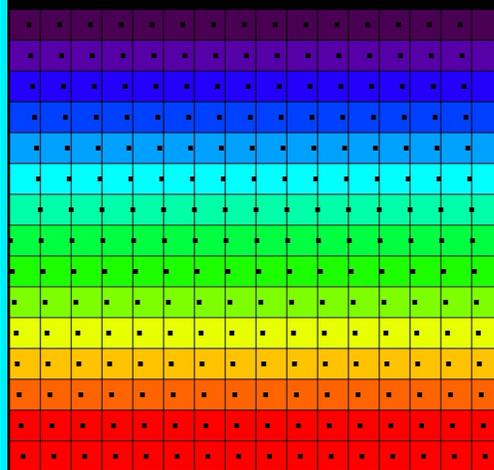

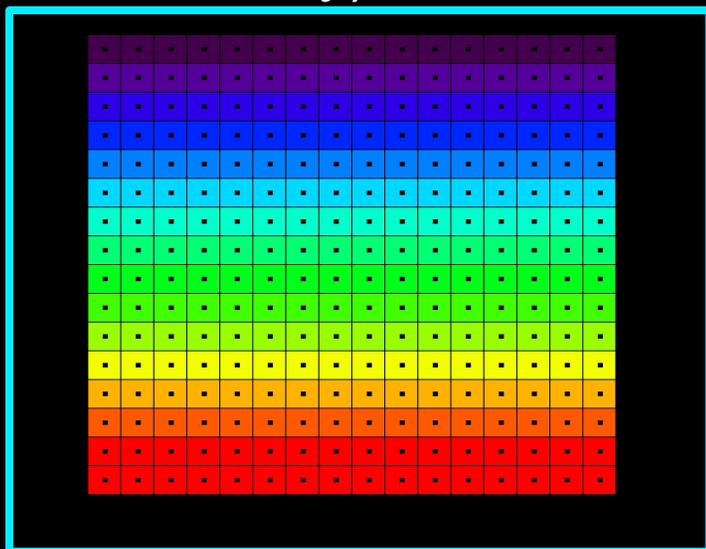

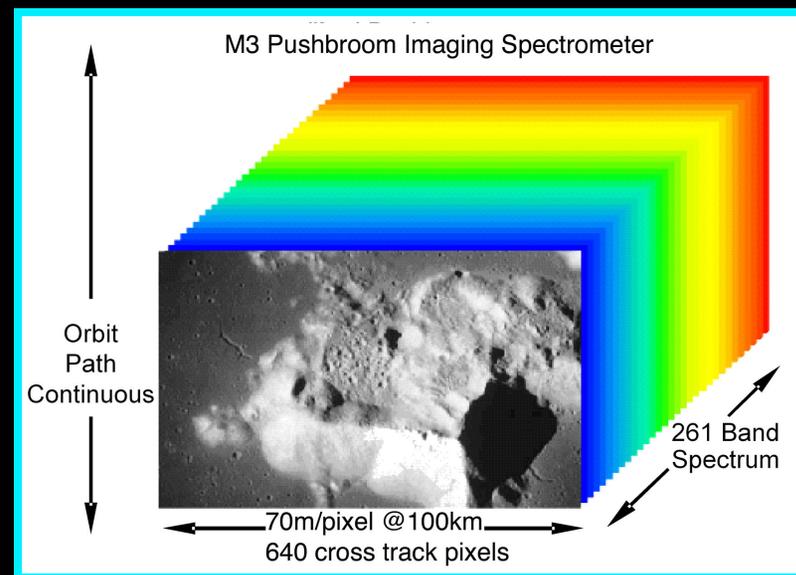

# M<sup>3</sup> Instrument

# Instrument Design

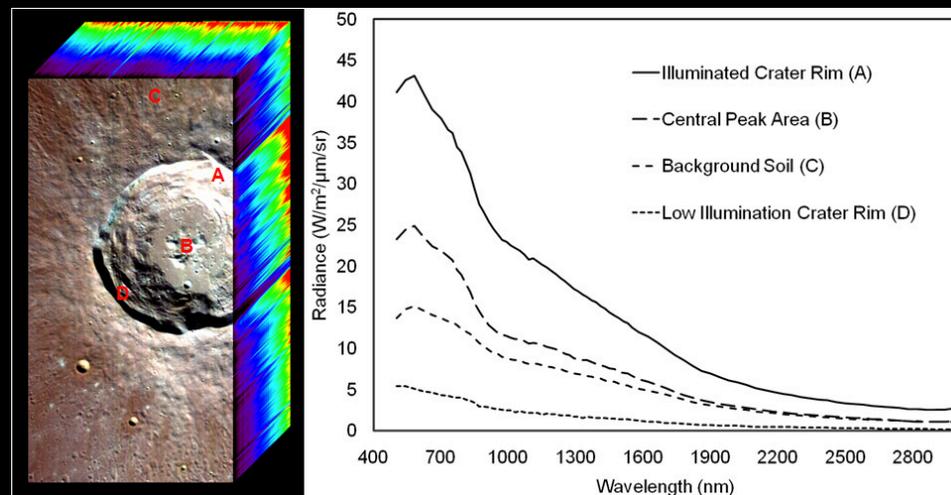

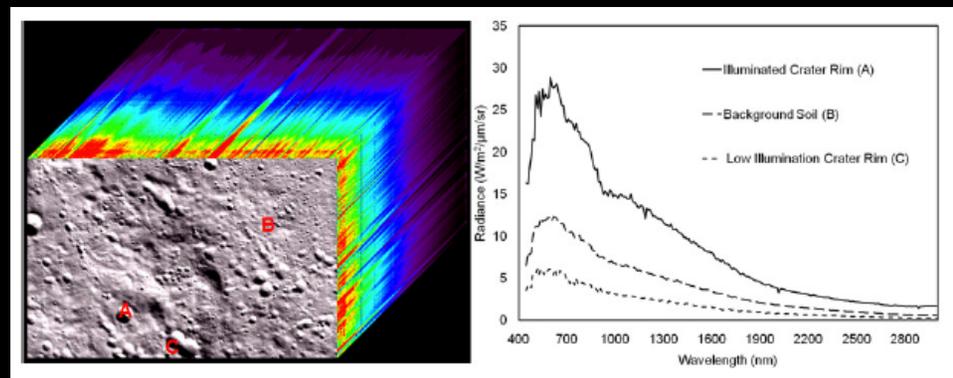

- Pushbroom imaging spectrometer
  - Each detector readout is 1 line of an image cube. The entire image is built as M3 moves along the ground track.
- High Spectral/Spatial Uniformity (>90% spectral crosstrack and spectral IFOV uniformity)

# Operational Modes

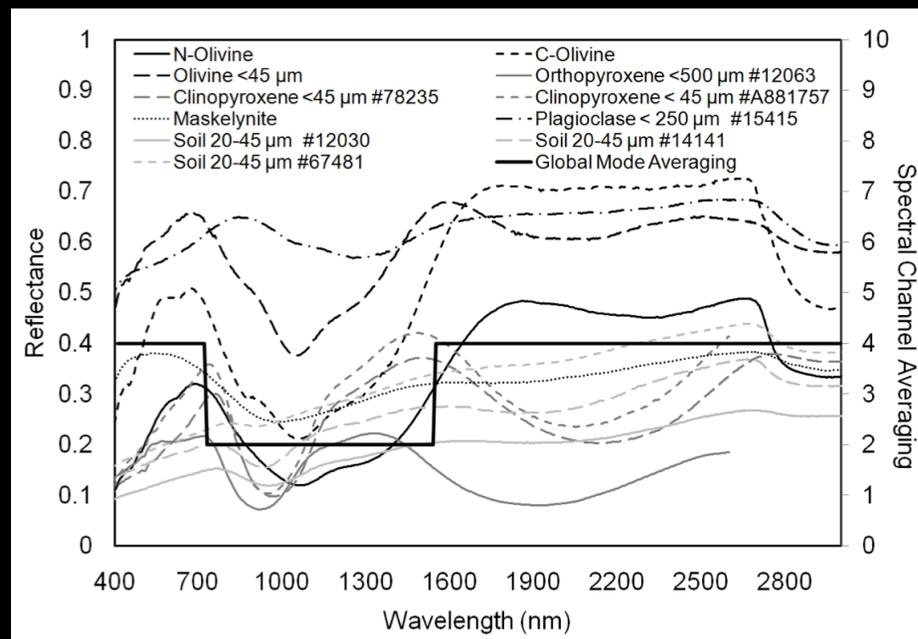

- Target
  - High spatial/spectral resolution mode for priority observations
  - Only a few target observations were actually acquired
- Global
  - M3 instrument acquires full resolution data then onboard software averages data to produce reduced resolution data
  - Lower resolution (spatial & spectral) mode for mapping the entire Moon
  - Majority of the M3 data set is global data

# Spatial and Spectral Resolution

- Spectral Coverage:
  - Target: 446-3000 nm
- Spectral Resolution:
  - Target: 10nm
  - Global: 20 or 40 nm
- Spatial Resolution:
  - Target: 70 m/pixel
  - Global: 140 m/pixel
  - Doubled when from 200km orbit (see later discussion of operational history)

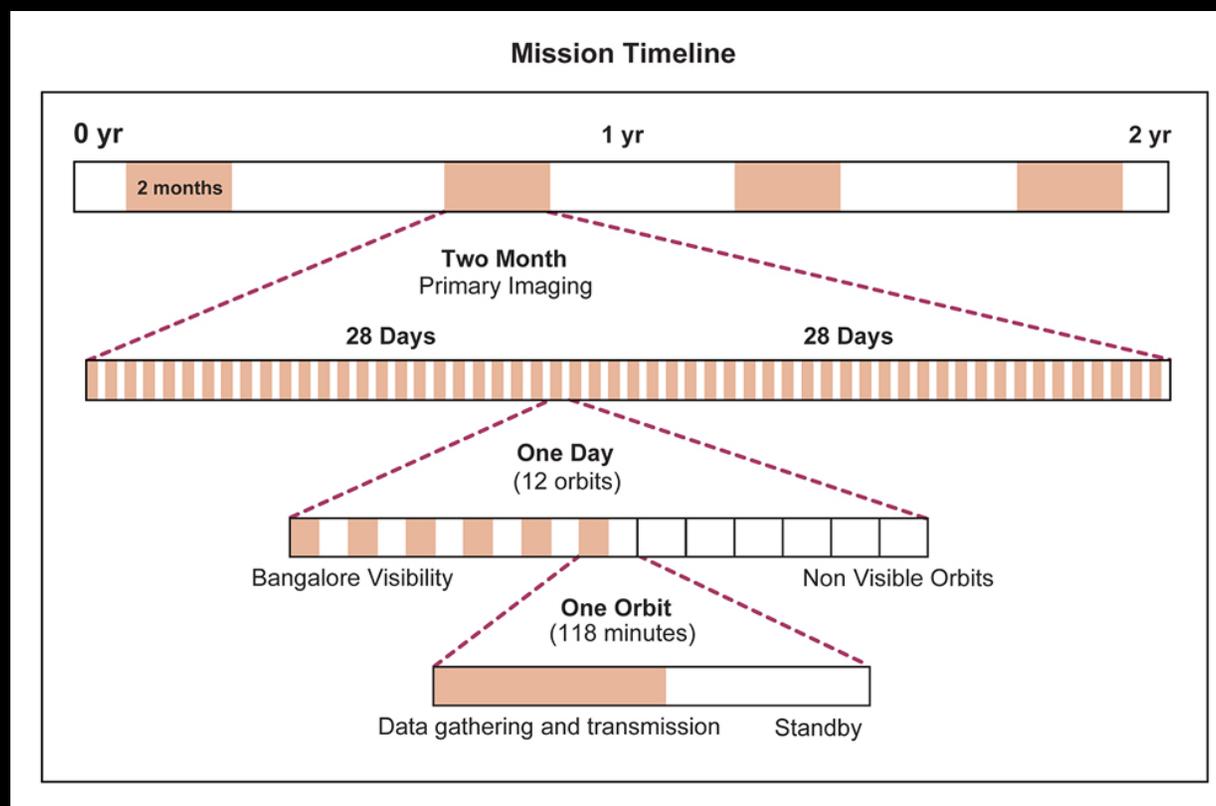

# *M3 Mission History*

# Planned vs. Actual Flight

- Planned observation time was 4 two-month optical periods defined by equatorial solar zenith of 0-45°

## *Planned vs. Actual Flight*

- Thermal issues plagued the spacecraft as soon as it arrived at the Moon on November 8, 2008
- Lost the 1<sup>st</sup> of 2 star trackers before a single image was taken
- Extended commissioning phase was required, lasting into Jan 2009

## *Planned vs. Actual Flight*

- The Chandrayaan-1 Mission Operations team did a fantastic job redesigning the mission in real time throughout the mission lifetime
- Despite all the challenges, we were able to meet baseline mission requirements thanks to heroic efforts on the part of Ch-1 and M3 team members
- LOLA topography data were essential for orthorectification

## Planned vs. Actual Flight

- Impact on data:
  - Instrument was operated at less favorable viewing conditions, resulting in lower reflected surface signal and increased effects of shadows
  - The spacecraft acquired data intermittently during two optical periods
    - Almost all M3 data were acquired in reduced resolution (“Global”) mode; very few optimal resolution (“Target”) mode observations acquired.
    - Most of 2<sup>nd</sup> optical period taken at higher orbit (200km vs 100km) and *with no star trackers*

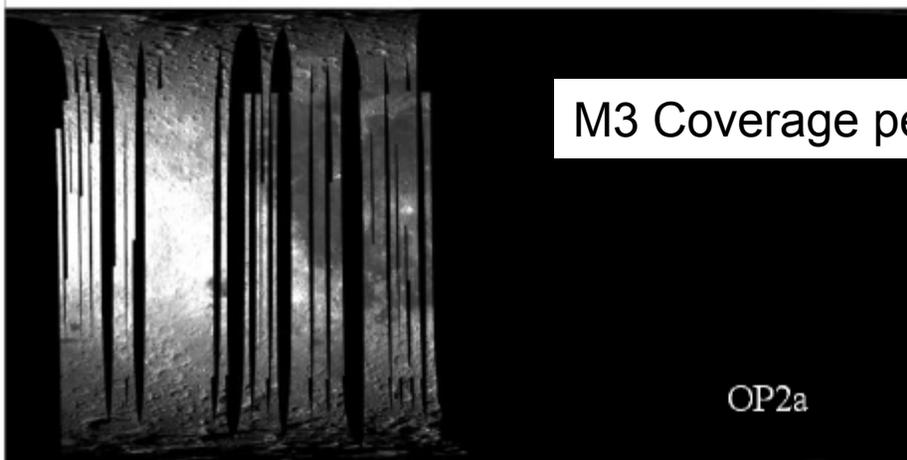

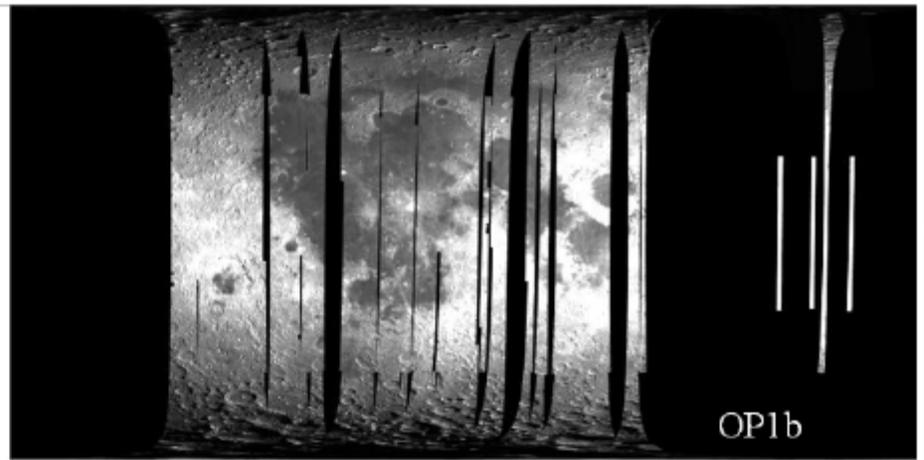

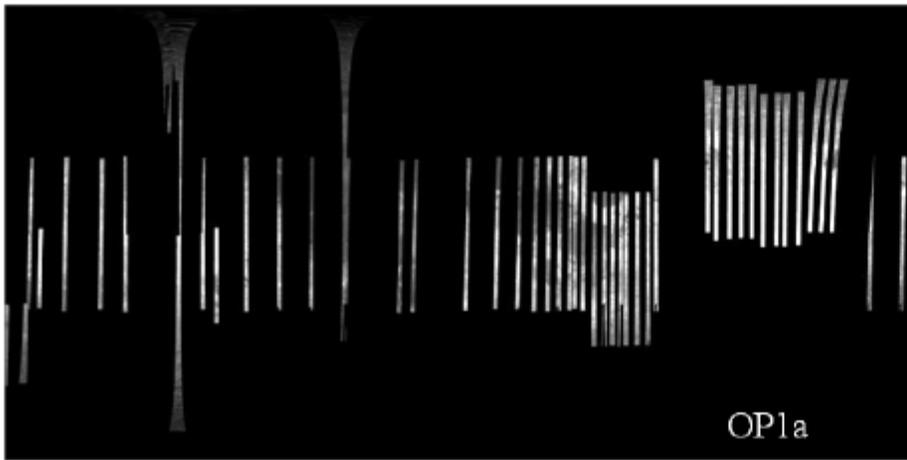

# M3 Optical Periods

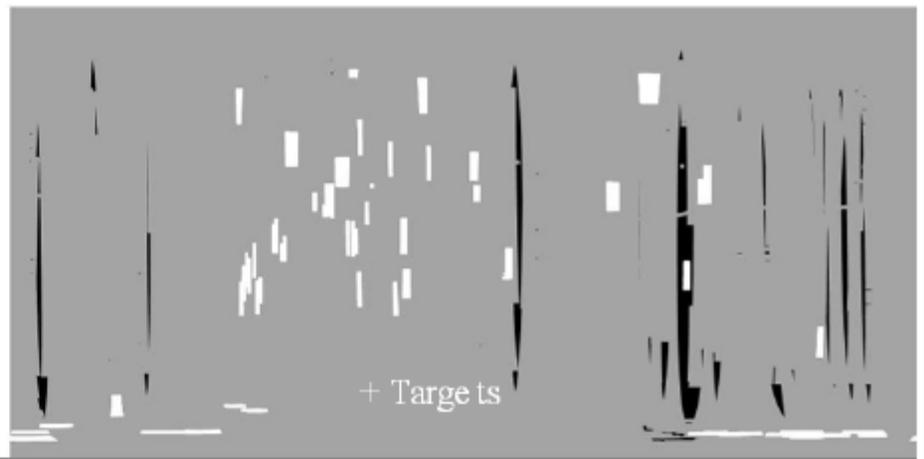

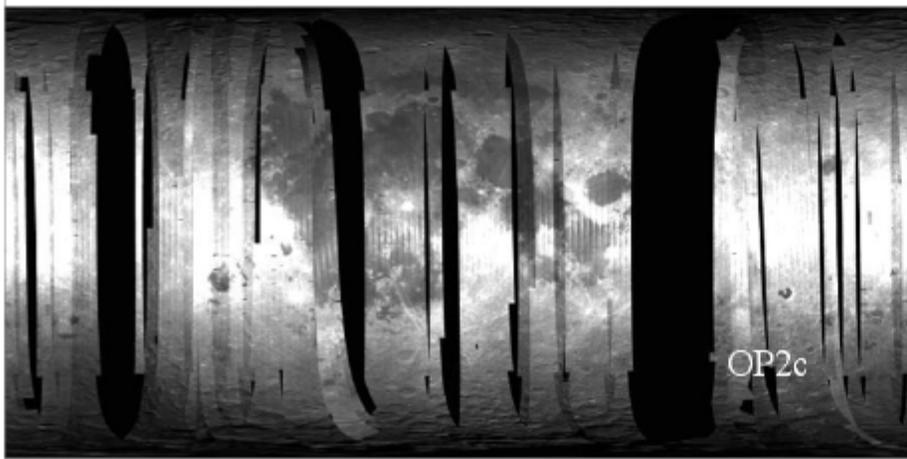

- M3 observed data during two optical periods, defined by favorable viewing conditions
- The team subdivided the optical periods based on data characteristics:

<u>Period</u>	<u>Dates</u>	<u>Images</u>	<u>Orbit</u>	<u>Star Sensors</u>	<u>Status</u>
OP1A	Nov 18 - Jan 24	119	100 km	1 of 2	extended commissioning
<b>OP1B</b>	<b>Jan 25 - Feb 14</b>	<b>247</b>	<b>100 km</b>	<b>1 of 2</b>	<b>operational, high solar zenith angles</b>
OP2A	Apr 15 - Apr 27	197	100 km	1 of 2	operational, high solar zenith angles
OP2B	May 13 - May 16	20	200 km	0 of 2	S/C emergency, orbit raised
<b>OP2C</b>	<b>May 20 - Aug 16</b>	<b>375</b>	<b>200 km</b>	<b>0 of 2</b>	<b>operational, variable conditions</b>

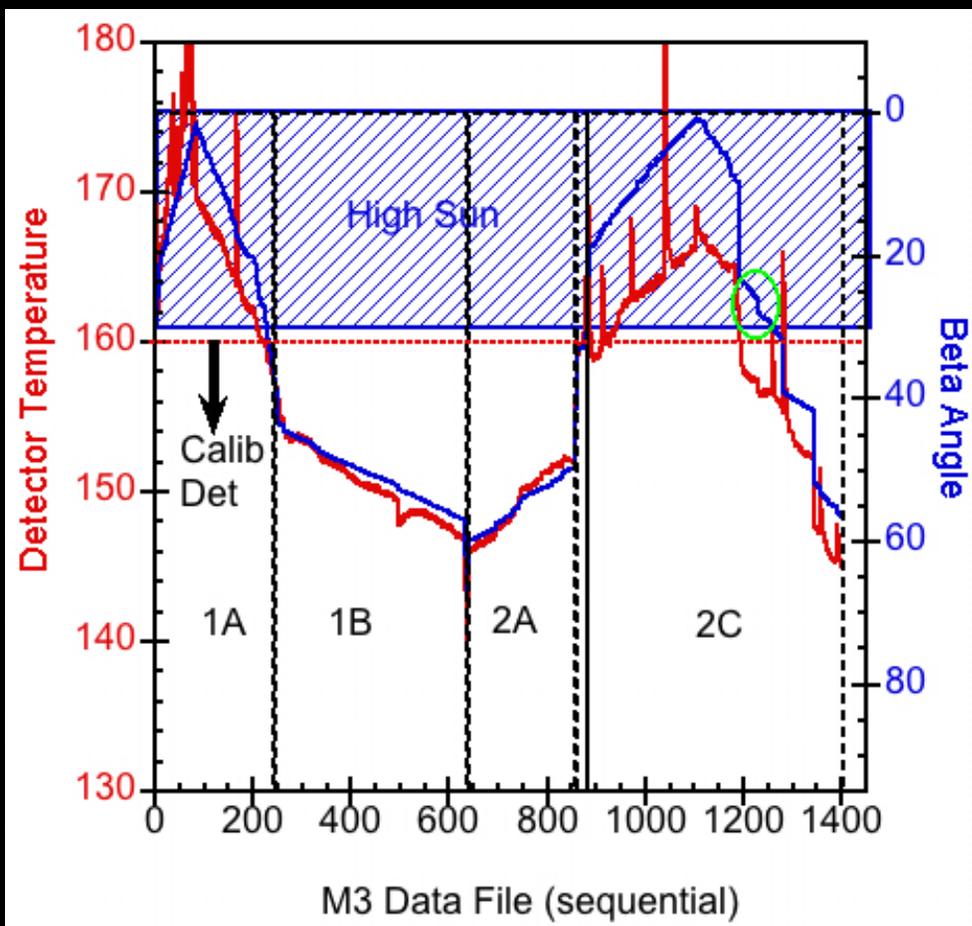

M3 Coverage per OP + Targets

# M3 Optical Periods

- Optimal low detector temperature acquisitions occurred during highest beta angles (angle between orbit plane and sun direction)

## ***PDS Releases***

- Level 0 and Level 1B:
  - OP1 (R3, R4 calibration): June 2010
  - OP2 (R4 calibration): December 2010
- Level 2 (projected R4 calibration):
  - OP1 and OP2: June 2011

L0 = raw spacecraft data, L1b=radiance + backplanes, L2 = reflectance

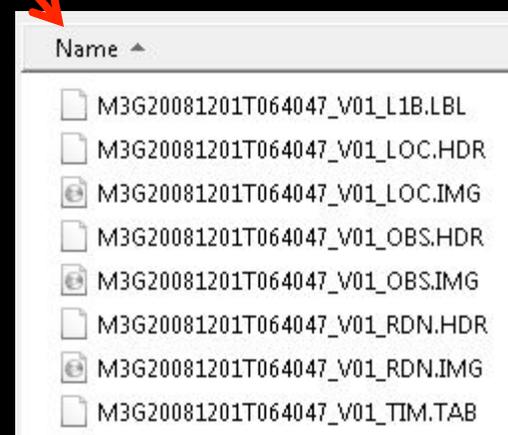

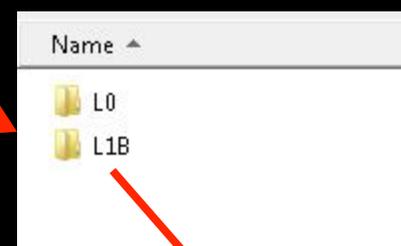

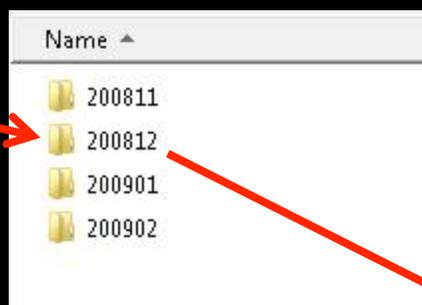

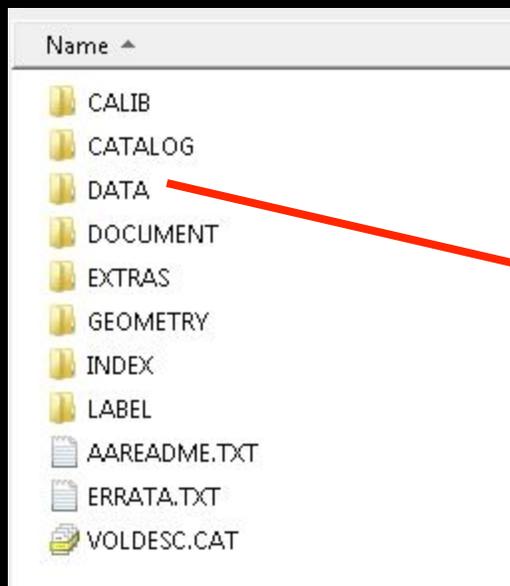

# ***M3 File Formats/PDS Structure***

# PDS Directory Structure

- Standard PDS structure

# M3 File Naming Convention

M3G20090204T113444\_V01\_RDN.IMG

└──────────────────────────────────┬──┬──┬──┬──┘  
Basename Pipeline Data File  
Type Type

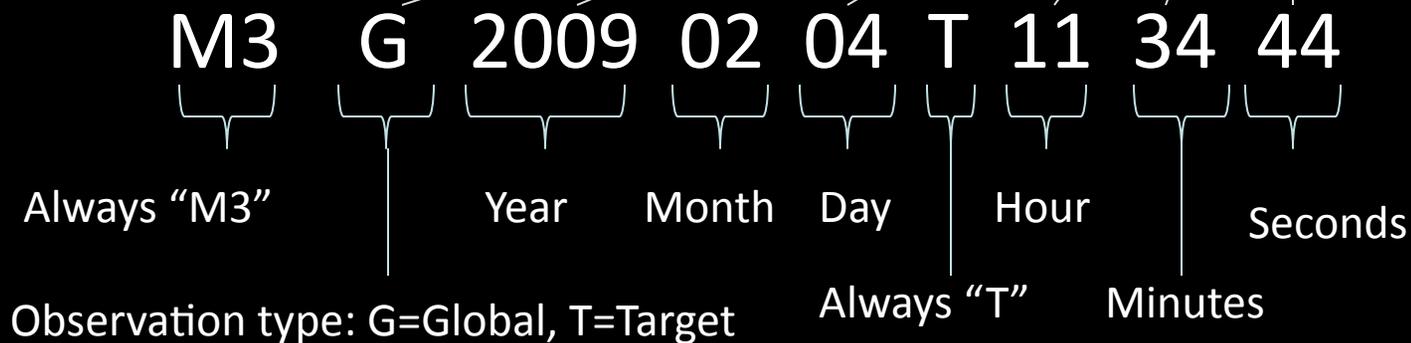

- Basename – covered next slide
- Pipeline – not used: was to be pipeline run number, but is always “V01” in PDS data
- Data type – tells you the type of information stored in the file
  - Possible values in L1B delivery:
    - LO – raw spacecraft data
    - RDN – radiance
    - OBS – observational data (incidence, emission, phase angles, etc.)
    - LOC – location data (latitude, longitude, radius)
    - TIM – time of observation
- File Type – tells you the file format
  - Possible Values in L1B delivery:
    - IMG – raw binary image data
    - LBL – PDS label
    - HDR – ENVI header
    - TAB – tabular data stored in ASCII format

# M3 File Naming Convention (cont'd)

Example Basename: M3G20090204T113444

Note: Sorting by filename is only equivalent to sorting by observation time if you do not have global and target data mixed together. If you do have a mix of the two, remove the first three characters then sort by filename to also sort by observation time.

## ***M3 image data format***

- The following applies to all M3 image data:
- Files are raw binary data (no offset)
- Interleave is BIL (line-interleaved)
- Global data have 304 samples (columns) for all image types (except L0, which has 320)
- Targeted data have 608 samples (L0 has 640)
- Number of lines (rows) is variable (determined by length of observation)
- Data type is 32-bit floating point (LOC files are 64-bit double precision floating point)
- “Backplanes” = OBS, LOC, and TIM files

## M3 Data types: L0

M3G20090126T033545\_V01\_L0.IMG

- L0 is raw spacecraft data, units are DN
- 320 samples which are reduced to 304 when converted to radiance
  - The 16 columns that are removed are for monitoring dark signal level and scattered light
- Each frame has a 1280-byte header
- To directly compare L0 to radiance:
  - No sample or line flip starting Nov 16 2008
  - Sample only flip starting Dec 18 2008
  - Line only flip starting Mar 14 2009
  - Sample and line flip starting Jun 18 2009

## M3 Data Types: L1B RDN

M3G20090126T033545\_V01\_RDN.IMG

- Radiance data, units  $W/(m^2 \text{ Sr } \mu\text{m})$
- Steps used to create radiance described in calibration slides
- PDS label or ENVI header can be used to open files
- ENVI Header contains:
  - Calibration steps
  - Target wavelengths (averaging for global)
  - Target FWHM
  - Dark Signal Image
  - Anomalous Detector Map
  - Flat Field Image
  - Detector Temperature
  - Beta Angle
  - Sample/Line flip code

## M3 Data Types: OBS

- List of bands in OBS file:
  - To-Sun Azimuth (deg)
  - To-Sun Zenith (deg)
  - To-M3 Azimuth (deg)
  - To-M3 Zenith (deg)
  - Phase (deg)
  - To-Sun Path Length (au-0.981919816030)
  - To-M3 Path Length (m)
  - Facet Slope (deg)
  - Facet Aspect (deg)
  - Facet Cos(i) (unitless)
- Values in the To-Sun Path Length band are the difference from the scene mean path length.

Scene-mean  
to-Sun path  
length

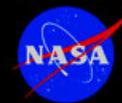

# M3 Data Types: OBS

Phase angle band

Facet cos(i) angle band

## ***M3 Data Types: LOC***

- List of channels in LOC file:
  - Longitude
  - Latitude
  - Radius
- Subtract lunar radius of 1737400 m to get difference in elevation from reference sphere
- Based on LOLA topography (see Boardman et al., in press)
- Reference frame is Moon Mean Earth Polar Axes (MOON\_ME) frame

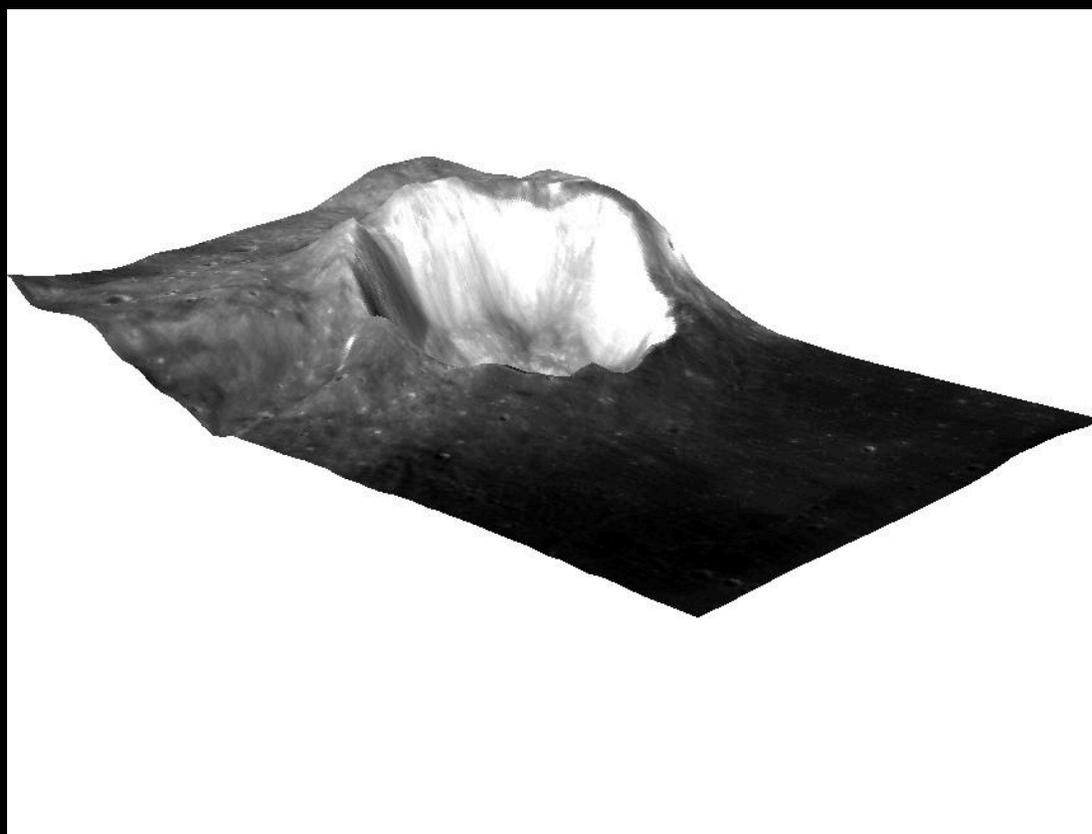

# M3 Data Types: OBS

Band 3 "Radius"

750 nm albedo draped over "Radius" band

# M3 Data Types: TIM

# Good Stuff in the PDS Directories

- CALIB
  - Record of detector temperatures, band pass functions, spectral calib. File (wavelength center positions), radiometric calibration coefficients
- DOCUMENT
  - Data Product SIS document that describes all files released to PDS down to the byte level; Archive Volume SIS describes PDS directory structure
- EXTRAS
  - Flat fields, anomalous detector element maps, quicklooks

# *Calibration*

# Converting L0 to L1 (Radiance)

- M3 Global Mode Calibrated Data version r4
- Raw image;
- Dark signal subtraction;
- Anomalous detector element interpolation;
- Interpolate filter edges c13, c50;
- Interpolate detector panel edges s81, s161, s241;
- Electronic panel ghost correction;
- Dark pedestal shift correction;
- Scattered light correction;
- Laboratory flat field;
- Image based flat field w/ photometry preserved;
- Apply radiometric calibration coefficients;
- Units ( $W/m^2/\mu m/sr$ )

See Green et al. (under review) for more detailed description.

## Basic calibration equation

$$L_{l,s,\lambda} = RCC_{\lambda} (C_{s,\lambda} (DN_{l,s,\lambda} - \overline{DS}_{s,\lambda}))$$

- L = calibrated radiance
- RCC = radiometric calibration coefficients
- C = term encompassing all correction factors (flat fields, etc.)
- DN = raw digital number
- DS = dark signal

# *Initial Steps of (ongoing) Level 2 Preparation*

## Converting Radiance to Reflectance

- Official M3 L2 Product is still under development
- Until that is available, team use an intermediate product called  $I/F$

$$I_0 F = \frac{I \pi d^2}{F}$$

- Where:
  - $I$  = radiance in  $\text{W}/\text{m}^2/\text{Sr}/\mu\text{m}$
  - $F$  = solar flux (solar spectrum) in  $\text{W}/\text{m}^2/\mu\text{m}$
  - $d$  = Moon-Sun distance in AU

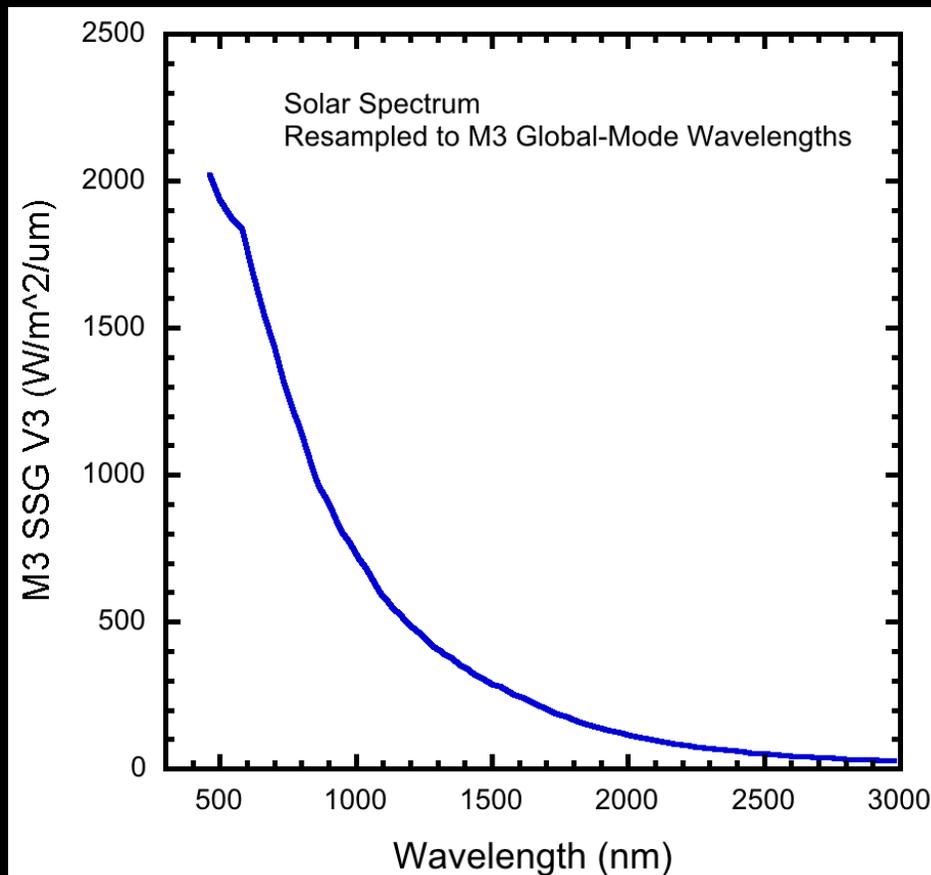

## Download M3 Solar Spectrum

[http://m3.jpl.nasa.gov/docs/solar\\_spec\\_global85.txt](http://m3.jpl.nasa.gov/docs/solar_spec_global85.txt)

[http://m3.jpl.nasa.gov/docs/solar\\_spec\\_target256.txt](http://m3.jpl.nasa.gov/docs/solar_spec_target256.txt)

- MODTRAN-based (See Green et al., 2010)
- Global and target resolution version can be downloaded in ASCII format from the above links
- See <http://m3.jpl.nasa.gov/m3data.html> for more

# Download M3 Solar Spectrum

- 3 lines of header information to be skipped when importing

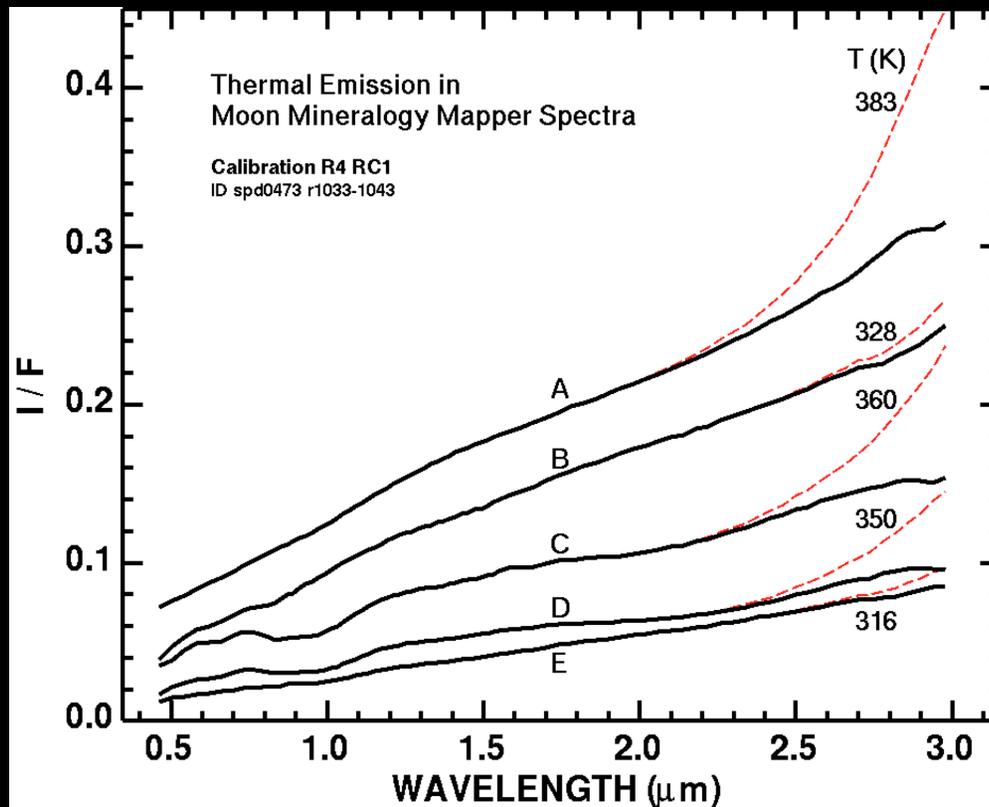

# ***Words of caution regarding M3 dataset (\*\*R4 Calibration\*\*)***

**\*\*R4 Calibration is the version included in the June 2010 (OP1) and Dec. 2010 (OP2) Level 1 PDS data releases\*\***

# Thermal emission at long wavelengths

- M3 data contain a component of emitted thermal (black body) radiation.
- More extreme for warm/hot surfaces; more notable at long wavelengths
- Removal of thermal emission is discussed by Clark et al. (2011)

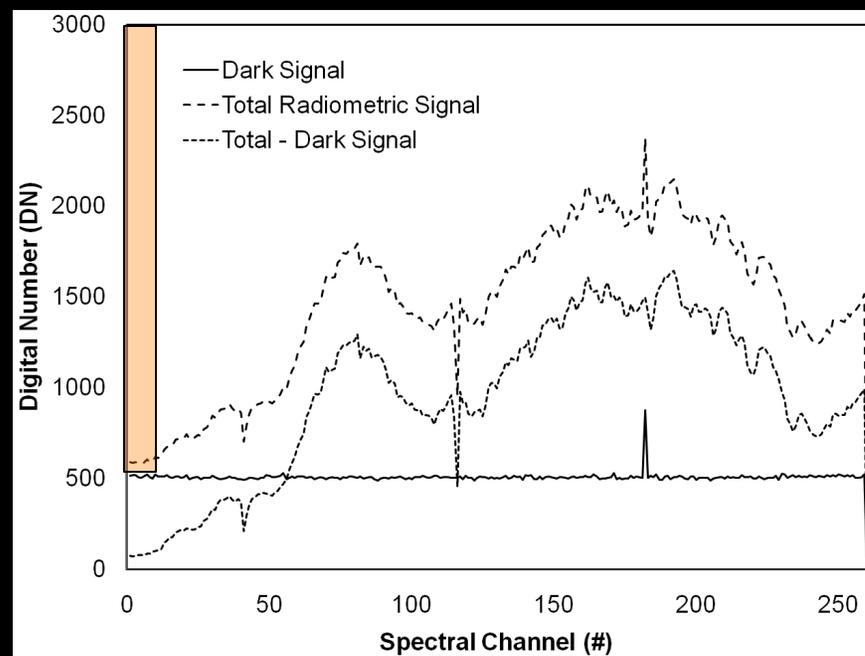

Clark et al., JGR, In Press

## Low signal levels at short wavelengths

- The shortest wavelengths have the lowest overall signal. Given the unfortunate low lighting conditions for much of M<sup>3</sup> data, these channels may not be far above the dark (offset) signal, which can contribute to a range of adverse effects on M3 data.
- **These wavelengths** thus often contain spurious effects and should **NOT** be used in ratio images or quantitative analyses.
- *L2 data from R4 data will probably be delivered with unreliable channels set to zero. [est. below 620 nm] (but will still contain 85 spectral bands).*
  - Caution should be exercised with R4 L1B data when converting to reflectance (L1B PDS archive does not have unreliable bands set to 0!).

Green et al., 2011, JGR submitted

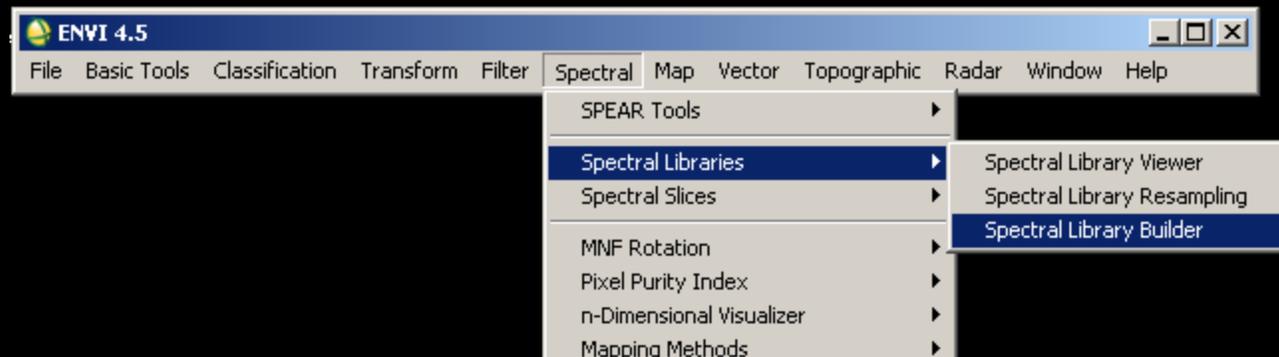

# ***Steps to convert radiance to I/F in ENVI***

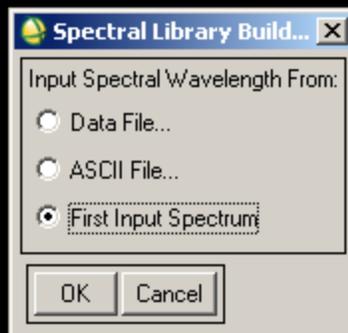

# Step 1: Import M3 Spectral Library

- Step 1:

- Step 2:

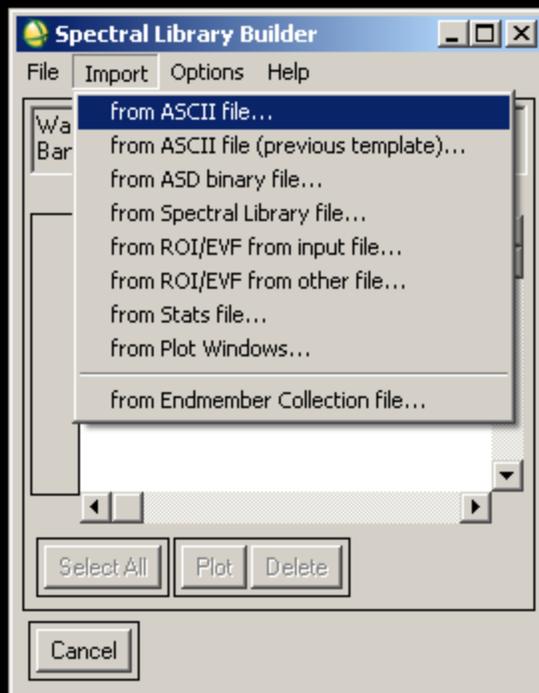

(Can also choose “ASCII File....” here but that has more steps)

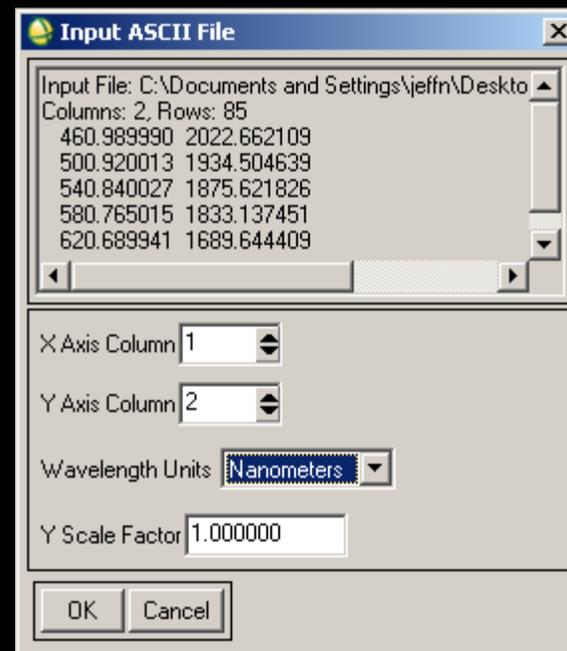

# Step 1: Import M3 Spectral Library

Step 3:

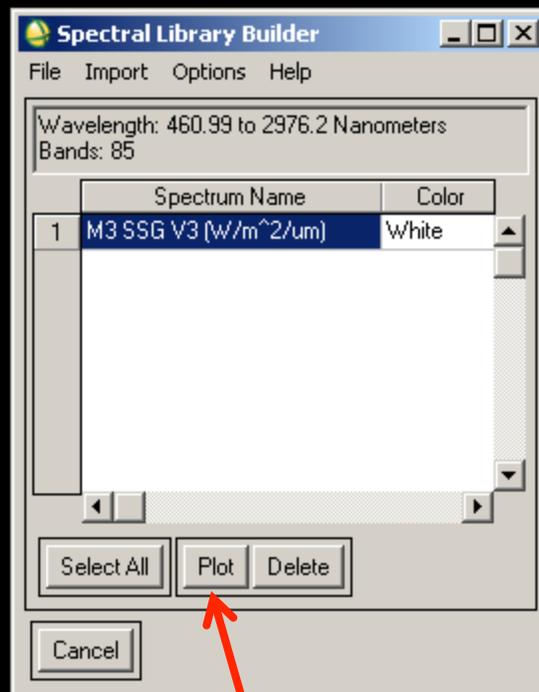

Step 4:

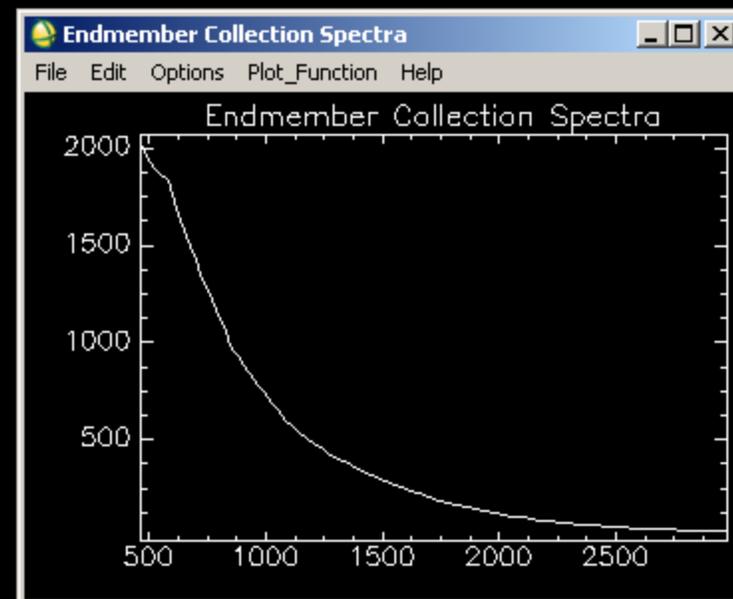

# Step 1: Import M3 Spectral Library

Step 3:

Click Plot

Done!

(Can save file as spectral library from File menu)

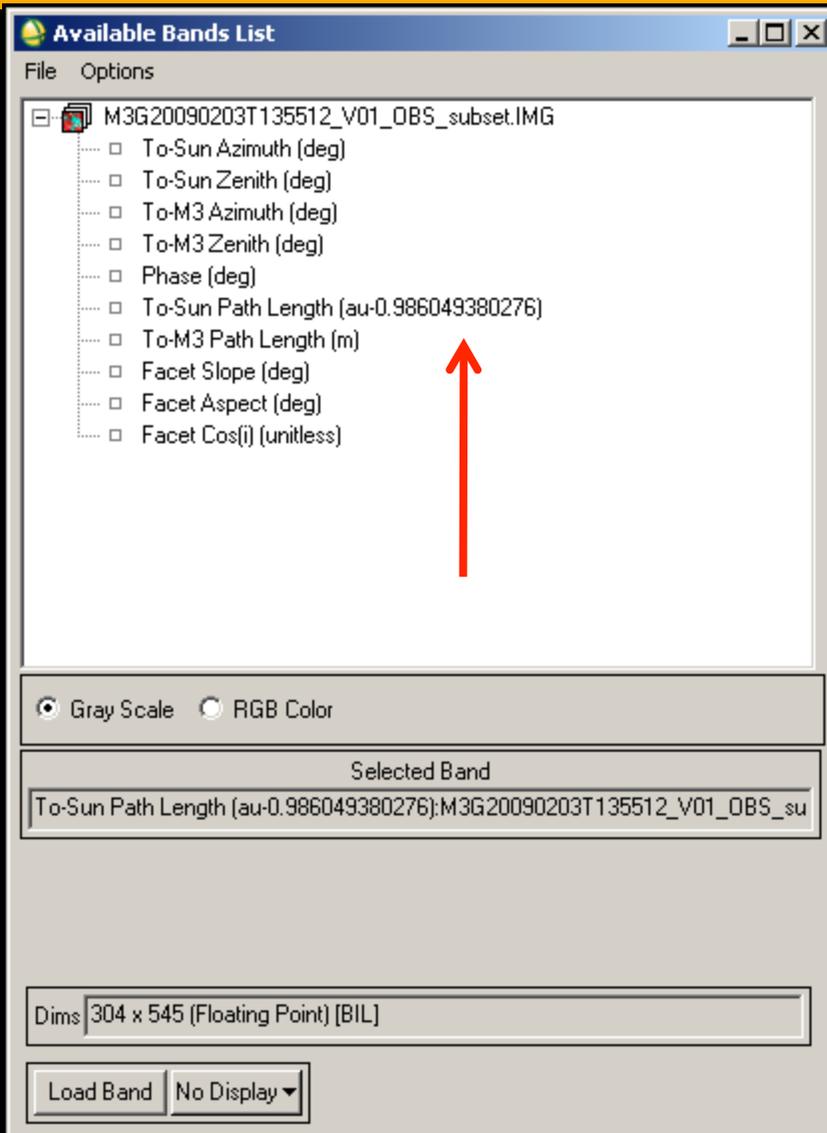

## Step 2: Open Files

- Open radiance (RDN) file in ENVI:
  - File > Open Image File
- Open observations (OBS) file also
  - This step can be skipped if you want to use 1.0 AU for the Moon-Sun distance (~2% error)
- Open and plot the M3 solar spectrum if you have not already

## Step 3: Get the Moon-Sun Distance

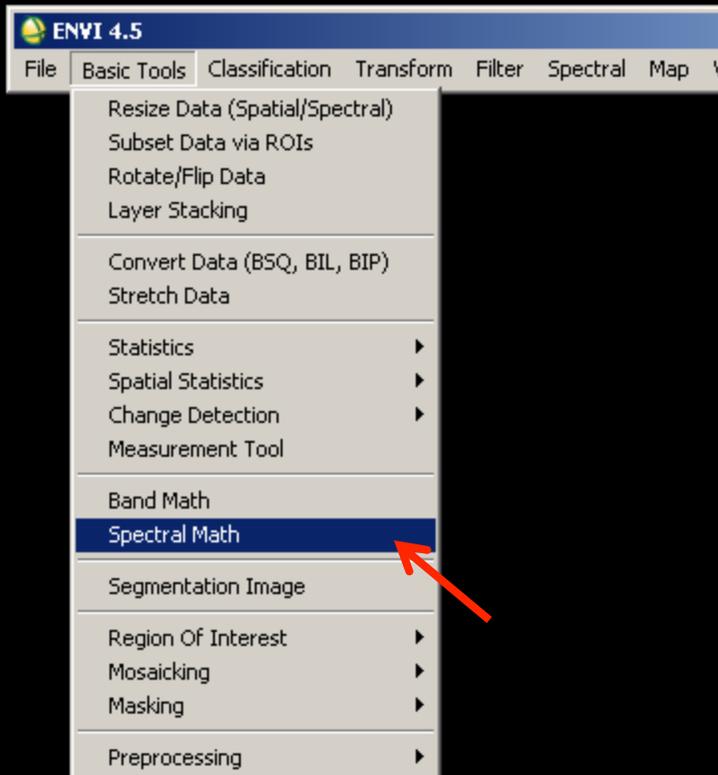

- Get mean distance from list of band names of the OBS file
- Could use per-pixel values in the To-Sun Path Length Band (band math)

## Step 4: Call Spectral Math

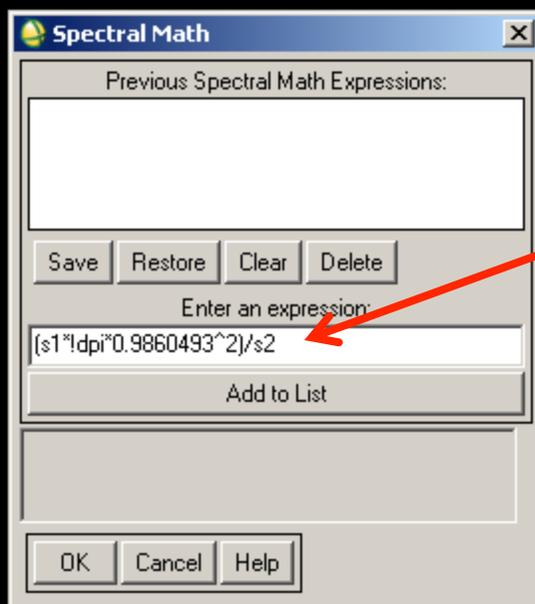

- Select Spectral Math under Basic Tools menu (also under Spectral menu)

## Step 5: Enter the expression

- Expression is:

$\text{float}((s1 * !dpi * 0.9860493^2) / s2)$

Radiance

Double  
precision  $\pi$

Moon-Sun  
distance  
squared;  
variable  
per file...

Solar  
Spectrum

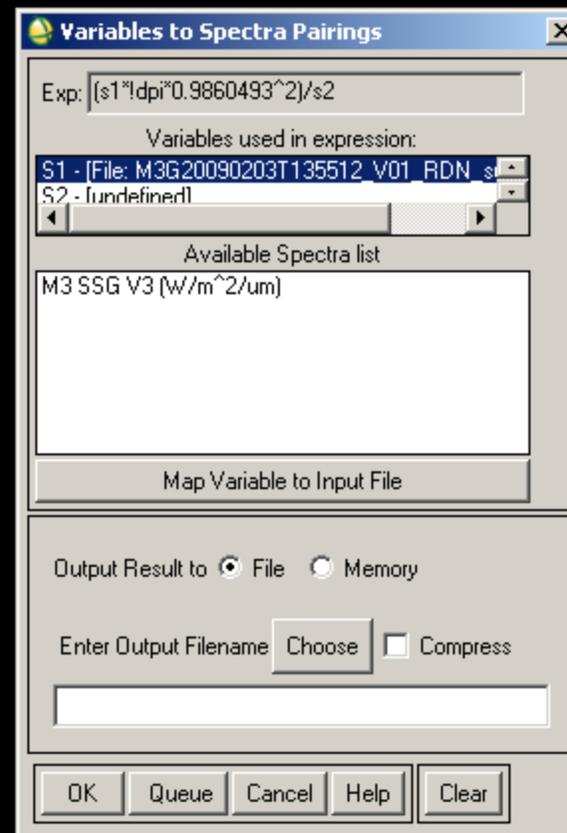

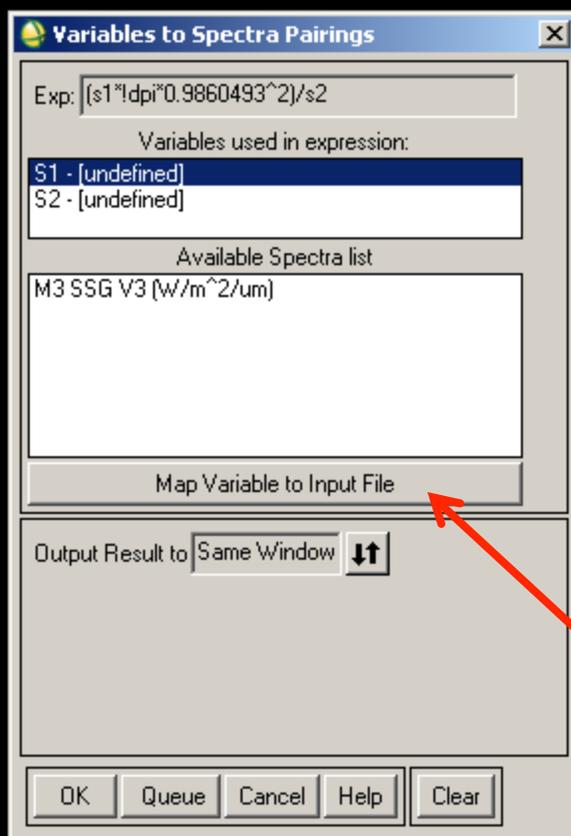

## Step 6: Define s1

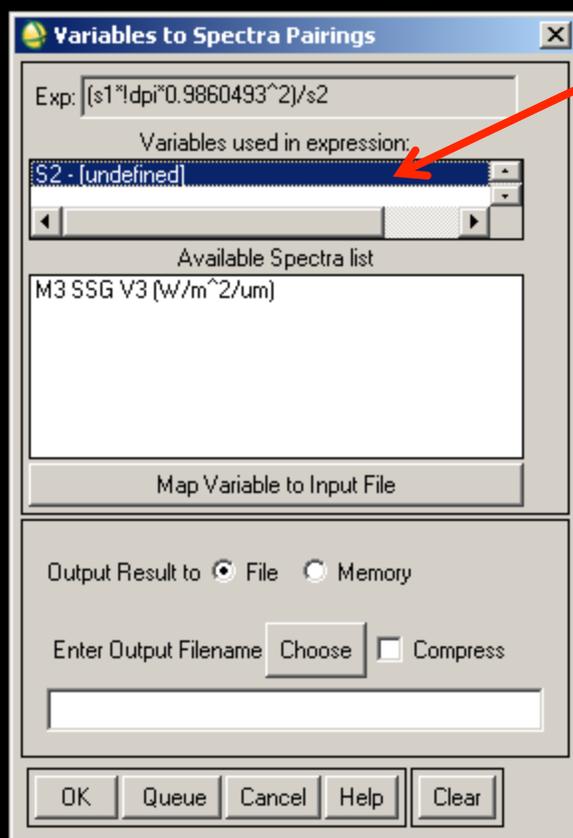

Click “Map Variable to Input File” and select your radiance (RDN) file

Should end up with this:

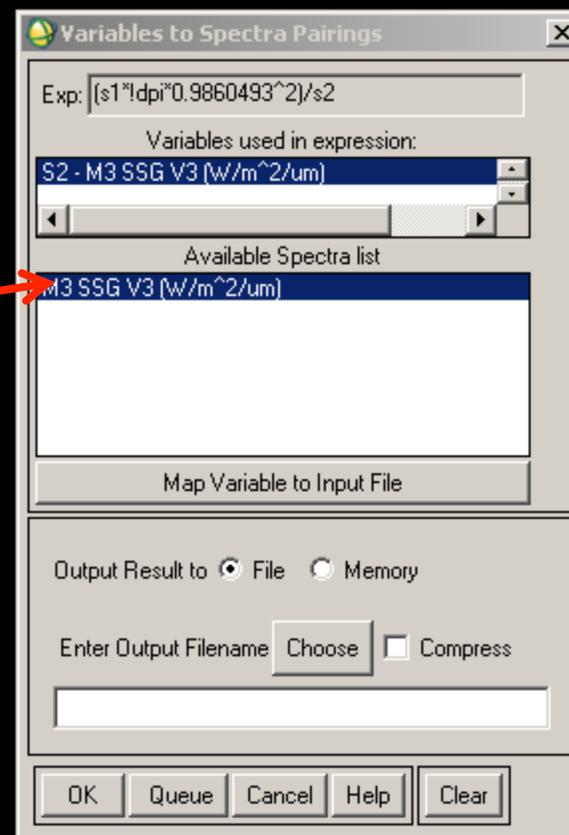

# Step 7: Define s2

First Click

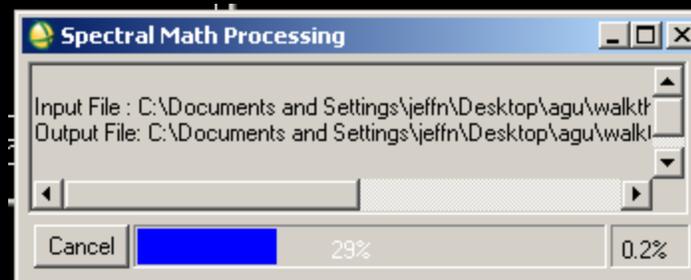

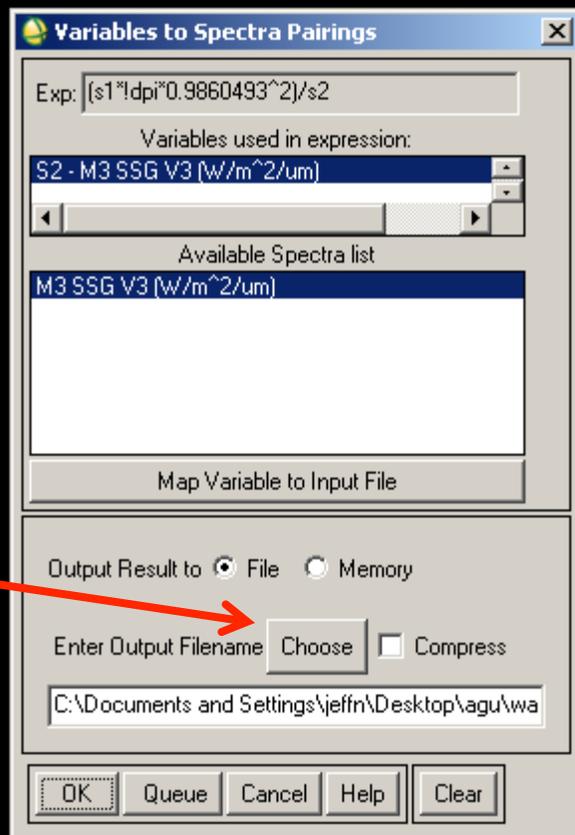

Second Click

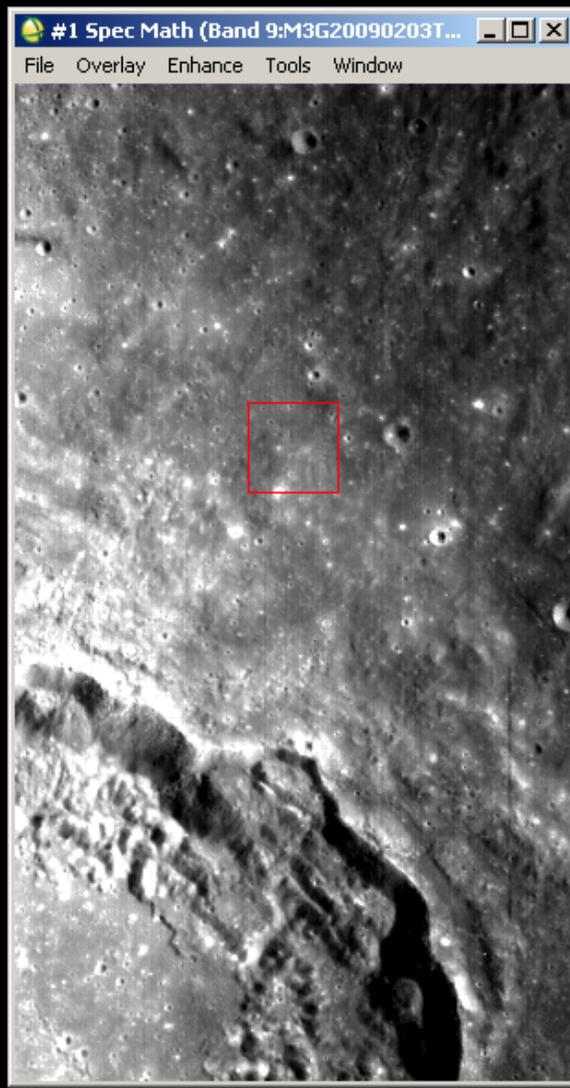

## Step 8: Choose Output File

- Then click “OK” and ENVI goes to work...

# Last Step: Enjoy!

## *Check your work!*

- Example radiance, observations, and I/F file posted to M3 website so that you can make sure you get the same answer we do:
- <http://m3.jpl.nasa.gov/m3data.html>
- Filename:  
M3\_TestSubsetCube\_M3G20090203T135512\_R4.zip
